

Hinkle_LexNLP_Example_Code

June 6, 2022

```
[1]: ### How to Extract Legal Citations using Python (for the complete beginner)  
### Law and Courts Newsletter  
### Rachael K. Hinkle  
### June 6, 2022  
### Run on macOS 10.15.7  
  
### The only difference in this code for Windows is the way filepaths are set up.  
↳ They use a different file separator.  
## Macs use a single forward slash; if you are using a mac run the following code:  
fileSeparator = "/"  
## Windows uses a double back slash: if you are using Windows use the following  
↳ code,  
# Note, to do this delete the "#" at the beginning of the next line.  
fileSeparator = "\\
```

```
[2]: # The following code turns off the autosave feature to avoid inadvertently  
↳ saving over a previous file.  
# As always, remember to save your work as you go along.  
%autosave 0
```

Autosave disabled

```
[3]: ## Preliminary Step 1: It helps to verify we are running Python 3.6 before  
↳ proceeding  
  
# Python tip: Any text preceded by a "#" is ignored by Python.  
  
import sys  
print(sys.version)
```

3.6.13 |Anaconda, Inc.| (default, Feb 23 2021, 12:58:59)
[GCC Clang 10.0.0]

```
[4]: ## Preliminary Step 2: Install the lexNLP package (only need to do this the  
↳ first time)  
# Note: This step will take a bit of time. When an asterisk appears in the  
↳ square brackets
```

```
# to the left of a cell (e.g. "In [*]"), that means the code is running. A
↳number will
# appear in the square brackets when the code is done running.
```

```
[5]: pip install lexnlp
```

```

```

[]:

```

[6]: ## Preliminary Step 3: Import the libraries you will need for this session
      ↪(analogous to R packages)

      # 'os' provides useful funtions for dealing with the operating system
      # 're' provides the ability to use regular expressions
      # 'csv' provides the ability to write the results to a .csv file
      # 'string' provides useful functions for processing the opinion content

```

```
# 'lexnlp' provides the ability to extract citations from natural language

import os, re, csv, string, lexnlp
import lexnlp.extract.en.citations
```

[]:

```
[7]: ## Preliminary Step 4: See the name of your working directory
os.getcwd()
```

```
[7]: '/Users/rachaelhinkle/Dropbox/Law_and_Courts_Newsletter_2022/Hinkle_L&C_Newslett
er_Dataverse_Files2'
```

```
[8]: ## Preliminary Step 5: Setup a shortcut reference to your working directory

# Python tip: This just creates a variable with a string.
#           You can name the variable anything you want.

mydir = os.getcwd() + fileSeperator
```

[]:

```
[9]: ### Illustration 1: How to extract citations from a single file
## Note: If you are familiar with Python, you can proceed to Illustration 2
```

```
[10]: ## Step 1.1: Read in an opinion (or other legal document) in a .txt file
# This code creates a list; each entry of the list is a string that contains the
  ↳text
# from one line in the file

# Python tip: The "print()" function is very useful for seeing the contents of
  ↳variable
#           to see or double check what the code is doing

# Note: If you get an error, check that the "mydir" variable correctly lists
  ↳your directory
# where the file is located, and/or make sure you have downloaded the "myExample.
  ↳txt" file from Dataverse.

tfile = open(mydir + "myExample.txt", "r", encoding="latin-1")
lines = tfile.readlines()
print(lines)
```

```

```
[11]: ## Step 1.2: Process the list from the previous step to create a single string
      ↪variable with
      #           only the majority opinion content

      #create an empty string variable (that we will later fill with the majority
      ↪opinion)
      opinText = ""

      #create a logical operator variable (think of this as a switch set to "off")
      opin = False

      # loop through each line in the document in turn, after each line it goes to the
      ↪next,
      # when there are no longer any lines left, the loop will stop
      for line in lines:
          # Check to see if the line starts with some or no white space followed by
          ↪"OPINION" and then the end of the line
          # If so, turn the switch "on" (by making the logical operator variable equal
          ↪True)
          # Once this switch is turned on, it will remain that way until we turn it off
          if re.search("^[\\s]*OPINION$", line):
              opin = True

          # Check for various strings that would indicate the end of the majority
          ↪opinion
```

```

    # If any of these patterns of text are found, turn the switch "off" by making
    ↳the logical operator variable equal False
    if line and (re.search("^[\\s]*DISSENT", line)):
        opin = False
    if line and (re.search("^[\\s]*CONCUR", line)):
        opin = False
    if line and (re.search("^[^A-Za-z]*APPENDI", line)):
        opin = False

    # For any line of text that occurs while the switch is "on", that is not
    ↳empty, add it
    # to the string variable where we are collecting the majority opinion text.
    if opin and not re.search("^[\\s]*$", line):
        opinText = opinText + line

# Now that the loop is complete, and we have the entire opinion, we can process it
# This code finds any instances of one or more spaces and substitutes a single
↳space
opinText = re.sub("\\s+", " ", opinText)

#Finally, we want to see our final product
print(opinText)

# Python tip: some elements of regular expressions used in the code above:
# ^: beginning of the line
# $: end of the line
# [\\s]*: zero or more white spaces
# [\\s]+: one or more white spaces
# [^A-Za-z]: Anything that is NOT a capital or lower case letter.
# (Inside the square brackets "^" means NOT, outside the brackets it means
↳beginning of the line)
# [A-Z] means any capital letter
# [a-z] means any lower case letter
# [A-z] means any letter
# [0-9] means any numeral

```

OPINION [*814] POSNER, Circuit Judge. The defendant pleaded guilty to being a felon in possession of a firearm and was sentenced under the federal sentencing guidelines (before the Supreme Court's Booker decision) to 188 months in prison, the bottom of the applicable guideline range but only eight months above the statutory minimum. [HN1] The Armed Career Criminal Act, 18 U.S.C. 924(e), imposes a 180-month minimum sentence on anyone [*815] who has at least three prior convictions of specified offenses. The judge found that the defendant's criminal record qualified under this provision, and [HN2] findings of prior convictions are not within the scope of Booker's rule. *United States v. Booker*, 160 L. Ed. 2d 621, 125 S. Ct. 738, 756 (2005); *United States v. Ngo*, 406 F.3d 839, 2005 WL 1023034, at *2-4 (7th Cir. 2005) [**2] .

[]:

```
[12]: ## Step 1.3: Extract citations from the opinion

#Extract each citation and put it in a variable
cite_holder = lexnlp.extract.en.citations.get_citations(opinText)

# See the citations extracted by using a loop
# Note: It doesn't work to just print the variable, but you can print (or ↵
↪otherwise access)
#     each item in it by using a loop.
for cite in cite_holder:
